- Flight Log and Telemetry compatible (optional)
- Patented MultiLink™ receiver technology
- X-Plus compatible
- QuickConnect™
- 200K resolution
- High-Speed 11ms operation when used with compatible transmitters

The Spektrum™ AR9020 is a 9-channel DSMX® receiver that gives you the option of adding extra channels simply by plugging a Spektrum X-Plus® channel expander into its SMOX port. This makes it ideal for scale models who like to push realism to the extreme with working accessories and lights, in addition to regular control functions. The AR9020 also includes two small, remote receivers that let you take advantage of patented Spektrum MultiLink™ technology. The remote receivers allow the AR9020 to "see around" conductive materials in the model and maintain a solid signal in any attitude.

The AR9020 full range 9-channel X-Plus™ compatible receiver features DSM2™ and DSMX technology and is compatible with all Spektrum™ and JR® aerial radios that support DSM2 and DSMX technology, including JR12EX, 11X, X9503, X9505, Spektrum DX40, DX8, DX7s, DX7se, DX6i, DX6 and Module Systems.

- Use as up to 9-channel aircraft, including:
- All types and sizes of glow, gas and electric powered airplanes
- All types and sizes of no-powered gliders
- All types and sizes of glow, gas and electric powered helicopters

IMPORTANT: Not for use in airplanes that have full carbon foerlagings OR that have significant carbon or conductive structures. We recommend using either the AR6255 or AR9200/AR9110 receivers for carbon foerlagings applications.

NOTE: The AR9020 receiver is not compatible with the Spektrum DX6 park flyer transmitter.
